Background: This includes what is already known and what is not known about the subject, and describes the purpose for the presentation and aim of study. It is important throughout to avoid using acronyms, misspellings and jargon from previous work.

Methods: This section includes details on how the study was carried out [1], such as sample sizes (and variations), source of sample if limited or defined by location, any requirements for inclusion, and duration of the study [2]. Generic drug names are preferable when describing dosage [3].

Results: This section should have detailed findings and comparisons summarized in complete sentences (see also Table 1 or Figure 1). The data will be used to define the Conclusion, which may be negative, or may not be significant. If all data cannot be shared and summarized in the limited space it may be helpful to deposit data in an open repository and focus on the primary purpose.

Conclusion: In addition to briefly summarizing the results, this section may also highlight new or unexpected results and advise on future studies. Statements may only refer to the author conclusions collectively and within a wider perspective rather than offering individual and subjective opinions.

Keywords: optional, consistently applied, relevant short phrases, limit of four.
